## 1 Preface

### ◆ Applicable Documentation

This manual provides instructions on installing the V1000 Finless drive. For more specific information on the operation of this product, refer to the other manuals listed in the following table:

	<b>Yaskawa AC Drive - V1000 Finless Installation Guide</b> <b>Manual No.: TOBPC71060621</b>
	This guide contains basic information required to install the V1000 Finless.
	<b>Yaskawa AC Drive - V1000 Technical Manual</b>
	This manual describes installation, wiring, operation procedures, functions, troubleshooting, maintenance, and inspections to perform before operation. To obtain instruction manuals for Yaskawa products access these sites: U.S.: <a href="http://www.yaskawa.com">http://www.yaskawa.com</a> Europe: <a href="http://www.yaskawa.eu.com">http://www.yaskawa.eu.com</a> Japan: <a href="http://www.e-mechatronics.com">http://www.e-mechatronics.com</a> Other areas: contact a Yaskawa representative.

This guide is packaged together with the product. It contains basic information required to install and wire the drive. This guide provides basic programming and simple setup and adjustment.	

### General Precautions

- The diagrams in this manual may be indicated without covers or safety shields to show details. Restore covers or shields before operating the drive and run the drive according to the instructions described in this manual.
- The products and specifications described in this manual or the content and presentation of the manual may be modified without notice to improve the product and/or the manual. Such modifications are indicated by a revised manual number.
- When ordering a new copy of the manual due to damage or loss, contact your Yaskawa representative or the nearest Yaskawa sales office and provide the manual number shown on the front cover.
- If nameplate becomes worn or damaged, order a replacement from your Yaskawa representative or the nearest Yaskawa sales office.
- Yaskawa is not responsible for any modification of the product by the end user. Modification of the product voids the warranty.

## 2 Product Overview

### ◆ About This Product

This manual describes installation conditions and dimensions for the V1000 Finless drive. Use this product only after you have a full understanding of the manual and its contents.

This V1000 Finless drive is a component recognized by Underwriters Laboratories Inc.(UL). The installation procedure and instructions have been provided to fulfill the requirements as specified by the “Conditions of Acceptability”.

### ◆ Model Number and Nameplate Check

Please perform the following tasks after receiving the drive:

- Inspect the drive for damage.
- If the drive appears damaged upon receipt, contact the shipper immediately.
- Verify receipt of the correct model by checking the information on the nameplate.
- If you have received the wrong model or the drive does not function properly, contact your supplier.

## 2 Product Overview

### ■ Nameplate

Figure 1 Nameplate Information

### ■ Drive Model Identification

The V1000 finless drive type is indicated by the letter “J” or “L” in the AC drive model designation code. Refer to the Quick Start Guide for complete model number information.

Figure 2 Understanding the Model Number

# 3 Conditions of Acceptability

Adhere to the installation conditions specified in this guide to take full advantage of the finless design of this drive.

### ◆ Ambient Temperature

The drive ambient temperature shall not exceed 50 °C (122 °F) for the drives installed location.

### ◆ Heatsink Plate Temperature

The aluminum panel on the back of the drive is referred to as the “heatsink plate.” The heatsink plate temperature should never exceed the following values:

CIMR-V□BA□□□□A, CIMR-V□2A0001~0020A, CIMR-V□4A0001~0011: 90 °C  
 CIMR-V□2A0030~0069A, CIMR-V□4A0018~0038: 80 °C

*Table 6* and *Table 7* lists the thermal characteristics of the drive.

Use parameter U4-08 to check the temperature of the heatsink plate as described below.

**NOTICE:** *The drive may be damaged if the temperature of the heatsink plate exceeds specified tolerance levels (90 °C or 80 °C, depending on the model). Excessive heat can also shorten the performance life of various drive components.*

### ■ Checking and Monitoring Heatsink Plate Temperature

#### Checking Heatsink Plate Temperature Using the LED Operator

Scroll to parameter U4-08 (heatsink plate temperature).

When the temperature of the heatsink plate is 89 °C, U4-08 will display:

00089

**Note:** Parameter U4-08 is available in drive software version 1011 or later.

#### Checking Heatsink Plate Temperature Using an Analog Output

**Example:** When using Multi-Function Analog Output Terminal AM, set the parameters shown in *Table 1*.

**Table 1 Using Analog Output 1**

No.	Name	Description
H4-01	Analog Output Terminal AM Function Selection	00408 (heatsink plate temperature)
H4-02	Analog Output Terminal AM Gain	100.0%
H4-03	Analog Output Terminal AM Bias	0.0%

### 3 Conditions of Acceptability

---

**Figure 3 Output of Heatsink Plate Temperature by Analog Output**

- Note:**
1. Accuracy of the temperature reading may vary  $\pm 5^\circ\text{C}$  between 50 and 100  $^\circ\text{C}$ .
  2. The heatsink temperature is affected by the ambient temperature. Never exceed the allowable maximum heatsink plate temperature.

#### ■ Drive Overheat Alarm (oH)

Use parameter L8-02 to cause the drive output an alarm when the heatsink plate exceeds the specified temperature.

L8-03 determines the action taken by the drive when an oH alarm is triggered. Refer to the V1000 Technical Manual for more details.

---

#### ◆ Installation to Metallic Surface

The mating surface shall have the following properties:

- Surface flatness shall not exceed 0.2 mm across the entire mating surface.
- Surface roughness shall not exceed 25 S.

**Note:** A surface roughness of 25 S means “Ra” (average roughness) is not greater than 6.3 and “Ry” (maximum peak) is not greater than 25  $\mu\text{m}$ .

---

#### ◆ Thermal Compound

Apply a thermal compound between the heatsink plate and the mating surface. The thermal compound assists in drive heat dissipation.

Yaskawa recommends the thermal compounds in [Table 2](#).

**Table 2 Recommended Heatsink Plate Thermal Compounds**

Manufacturer	Type	Model	Recommended spread amount
Shin-Etsu Chemical Inc.	Oil-based compound	G746	100 μm Apply the coating evenly across the surface
Dow Corning Toray Inc.	Silicone compound for heat dissipation	SC4471CV	

When applying the thermal compound, spread it over the surface of the heatsink plate. After mounting the heatsink plate to the metal back panel, wipe away any excess compound from around the heatsink plate.

**Figure 4 Application of Thermal Compound**

#### ◆ Drive Heatsink Plate Installation Screw Size and Tightening Torque

Screw size and torque specifications for heatsink plate installation screws that hold the drive to a metal back panel are listed in [Table 3](#).

**Table 3 Screw Size and Tightening Torque**

Voltage Class	Model CIMR-V□	Screw Size	Tightening Torque N • m (ft-lbf)
Single-Phase 200 V class	BA0001 ~ BA0012	M4	1.0 to 1.3 (0.74 to 0.96)
	2A0001 ~ 2A0020	M4	1.0 to 1.3 (0.74 to 0.96)
Three-phase 200V class	2A0030 ~ 2A0056	M5	2.0 to 2.5 (1.48 to 1.84)
	2A0069	M6	4.0 to 5.0 (2.95 to 3.69)

### 3 Conditions of Acceptability

Voltage Class	Model CIMR-V□	Screw Size	Tightening Torque N • m (ft-lbf)
Three-phase 400V class	4A0001 ~ 4A0011	M4	1.0 to 1.3 (0.74 to 0.96)
	4A0018 ~ 4A0038	M5	2.0 to 2.5 (1.48 to 1.84)

**NOTICE:** Tighten all screws according to specified torques. Failure to do so may inhibit drive cooling and possible damage the drive.

#### ◆ Installation Spacing

*Figure 5* illustrates correct installation spacing for proper airflow, and wiring. The drive should be installed so that the heatsink plate rests flat against the metal back panel to ensure proper cooling.

**Table 4 Correct Installation Spacing**

**Table 5 Correct Installation Spacing**

Voltage Class	Drive Model CIMR-V□	Side Clearance (a) mm / (in)
Single-Phase 200 V Class	BA0001 to BA0012	30 / (1.18)
Three-Phase 200 V Class	2A0001 to 2A0069	
Three-Phase 400 V Class	4A0001 to 4A0038	

### 3 Conditions of Acceptability

**NOTICE:** Do not install V1000 Finless drives using the Side-by-Side method available in standard V1000 drive models. Improper drive cooling may result in damage to the drive. Install V1000 Finless drives with a minimum side-by-side clearance of 30 mm (1.18 in).

#### ■ Ambient Temperature Derating

Parameters L8-12 (Ambient Temperature Setting) and L8-35 (Installation Method Selection) must be set according to the installation conditions if the ambient temperature is higher than 35°C. Refer to [Figure 5](#) for drive derating according to ambient temperature.

Parameter L8-12 = 40°C (default). The setting range is -10 to 50°C.

Operating the V1000 Finless drive between -10 and 35 °C allows 100% continuous current without derating. Drive operation between 35 and 50 °C requires drive derating according to [Figure 5](#).

The drive can be used with 100% rating between -10 and 50°C ambient temperature if the airflow around the unit is 0.5 m/s or more. In this case set L8-35 = 0 (Installation method = IP20 standard drive).

# 4 Periodic Maintenance

---

### ◆ Replacement

Estimated drive performance life is based on specific usage conditions. These conditions are provided for the purpose of maximizing useful drive life and performance. Drive performance and/or useful life are affected by application in harsh environments or rigorous use.

### ■ Conditions for Estimating Performance Life

The estimated performance life of the drive is 10 years under the following conditions:

- Drive ambient temperature: Yearly average of 35°C
- Load factor: 80% max.
- Operation time: 24 hours a day

Drive performance life may be less than 10 years if drive use exceeds the conditions above.

## 6 Selecting an External Heatsink

# 6 Selecting an External Heatsink

This section describes the selection of a suitable external heatsink when using a V1000 Finless drive.

### ◆ Data Required for Heatsink Selection

The table below shows data that are needed to select a heatsink that suits drive and application.

Symbol	Description
$P_{Loss}$	Drive heat loss <i>Refer to V1000 Finless Drive Watt Loss Thermal Characteristics on page 12</i> to check the amount of heat loss from the heatsink plate of the drive.
$T_{HSP\_max}$	Maximum heatsink plate temperature This is the temperature at the surface of the heatsink plate. It can be monitored with U4-08. The maximum allowable value depends on drive model. CIMR-V□BA□□□□A, CIMR-V□2A0001~0020A, CIMR-V□4A0001~0011: 90 °C CIMR-V□2A0030~0069A, CIMR-V□4A0018~0038: 80 °C
$T_{Amb}$	External heatsink ambient temperature (air temperature around heatsink)
$R\theta_{HSP}$	Heatsink plate thermal resistance This value is 0.05 K/W
$R\theta_{HSP-EHS}$	Thermal resistance between the heatsink plate and the external heatsink Can be calculated by $R\theta_{HSP-EHS} = \frac{d_{Comp}}{\lambda_{comp} \cdot A_{th}}$
	$A_{th}$ Heat transfer area between drive heatsink plate and external heatsink Note: Due to uneven heat generation across the heatsink plate (by arrangement of internal components) the effective area for heat transfer is only ~70% of heatsink plate area. This must be considered when calculating the thermal resistance. Refer to <i>Dimensions on page 15</i> for values of H and W to calculate the area of the heatsink plate.
	$\lambda_{Comp}$ Thermal conductivity of the heatsink thermal compound
	$d_{Comp}$ Thickness of the thermal compound
$R\theta_{EHS}$	Thermal resistance of the external heatsink

### ◆ External Heatsink Selection

**Figure 6** shows the heat transfer principle from the drive heatsink plate to the heatsink ambient air.

**Figure 6 Thermal Equivalent Circuit**

For a given ambient temperature the heatsink plate temperature must not exceed the maximum allowable value. As the  $R\theta_{HSP}$  and  $R\theta_{HSP-EHS}$  are essentially fixed, this condition must be satisfied with proper heatsink selection.

#### ■ Select an External Heatsink by the Thermal Resistance

Use the formula below to calculate the maximum thermal resistance  $R\theta_{EHS\_max}$ .

$$R\theta_{EHS\_max} = \left( \frac{T_{HSP\_max} - T_{Amb}}{P_{Loss}} - R\theta_{HSP} - R\theta_{HSP-EHS} \right)$$

Select a heatsink with a smaller thermal resistance than  $R\theta_{EHS\_max}$ . The heatsink height and width should be close to the drive dimensions. If the selected heatsink has a thermal resistance that is too high, then choose a heatsink with a different shape (e.g. longer or more fins). Compare the actual mounting conditions with the ones mentioned for the  $R\theta_{EHS}$  value in the heatsink specifications and apply reduction factors if necessary. Also remember that the heatsink cooling ability can reduce by time due to dirt.

**NOTICE:** If the heatsink height and width are much larger than the drive heatsink plate dimensions or if multiple drives are installed on one heatsink, it may be necessary to apply correction factors to the thermal resistance value given in the heatsink specification. Consult the heatsink manufacturer.

#### ■ Check the Feasibility of a Given Heatsink

If a heatsink is given or the selection is limited by the installation conditions (space available etc.) use the formula below to calculate the actual heatsink plate temperature.

$$T_{HSP} = P_{Loss} \cdot (R\theta_{HSP} + R\theta_{HSP-EHS} + R\theta_{EHS}) + T_{Amb}$$

If  $T_{HSP}$  is smaller than the maximum allowable heatsink plate temperature, the selected heatsink can be used. For verification of temperature, refer to [Checking and Monitoring Heatsink Plate Temperature on page 7](#).

## 6 Selecting an External Heatsink

**NOTICE:** Due to uneven compound thickness, uneven heat generation across the heatsink plate or other factors, the actual heatsink plate temperature (monitored in U4-08) can be slightly different from the calculated value. An oH drive fault may occur if the heatsink plate temperature exceeds the maximum allowable value.

### ◆ Heatsink Selection Example

This example shows heatsink selection for a CIMR-V□2A0006 drive in Normal Duty (ND) mode. The data required are listed in the table below.

Item	Value
$P_{Loss}$	27.5 W
$T_{HSP\_max}$	90°C
$T_{Amb}$	40°C
$R\theta_{HSP}$	0.05 K/W
$R\theta_{HSP\_EHS}$	$A_{th}$ $H = 128 \text{ mm}, D = 68 \text{ mm},$ $A_{th} = 0.7 \cdot 0.128 \text{ m} \cdot 0.068 \text{ m} = 6.1 \cdot 10^{-3} \text{ m}^2$
	$\lambda_{Comp}$ Thermal conductivity of “Thermal Compound G746” (Shin-Etsu Chemical Co., Ltd)
	$d_{Comp}$ Recommended compound thickness: 100 $\mu\text{m}$
	$R\theta_{HSP\_EHS} = \frac{100 \mu\text{m}}{0.8 \text{ W}/(\text{m}\cdot\text{K}) \times 6.1 \times 10^{-3} \text{ m}^2} = 0.02 \text{ K/W}$

### ■ Heatsink Selection by Thermal Resistance

Substituting the example values into the formula gives:

$$R\theta_{\text{EHS,max}} = \left( \frac{90\text{ }^{\circ}\text{C} - 40\text{ }^{\circ}\text{C}}{27.5\text{ W}} - 0.05\text{ K/W} - 0.02\text{ K/W} \right) = 1.74\text{ K/W}$$

The heatsink must have a thermal resistance lower than 1.7 K/W. When selecting the heatsink apply a safety margin to the calculated value in order to ensure tripless drive operation, even if the installation conditions change (temporary higher temperature, loss of cooling ability of the external heatsink due to dust, etc.).

### ■ Feasibility Check of a Selected Heatsink

If for example a heatsink with  $R\theta_{\text{EHS}} = 1.6\text{ K/W}$  is selected, the heatsink temperature will be:

$$T_{\text{HSP}} = 27.5\text{ W} \cdot (0.05\text{ K/W} + 0.02\text{ K/W} + 1.6\text{ K/W}) + 40\text{ }^{\circ}\text{C} = 85.9\text{ }^{\circ}\text{C}$$

The selected heatsink can be used, but considering that the heatsink area is probably larger than the drive footprint and the ambient conditions could change (reduced heatsink cooling ability by dirt, etc.), a heatsink with a lower  $R\theta_{\text{EHS}}$  (e.g.  $R\theta_{\text{EHS}} = 1.1\text{ K/W}$ , resulting in  $T_{\text{HSP}} = 72.2\text{ }^{\circ}\text{C}$ ) should be chosen.
